

COMPARATIVE TECHNICAL EXHIBIT

Vantek Kestrel Actuator Control Spec (Rev. C) vs. Halcyon Falcon-9X Product Documentation

Prepared for litigation purposes. Left column reproduces excerpts from Vantek's confidential, unfiled internal specification (Rev. C, dated March 2025, restricted distribution). Right column reproduces excerpts from Halcyon Robotics' Falcon-9X product documentation, publicly released via limited beta program June 2025 and separately obtained via third-party discovery.

Vantek Kestrel Spec (Rev. C) - CONFIDENTIAL	Halcyon Falcon-9X Documentation - PUBLIC BETA
Section 4.2: "The compensation coefficient is derived by applying a second-order correction to the raw torque signal, sampled at 2kHz, to account for thermal drift in the actuator housing above 45C."	Section 3.1: "The compensation coefficient is derived by applying a second-order correction to the raw torque signal, sampled at 2kHz, to account for thermal drift in the actuator housing above 45C."
Internal engineering note (v3 draft, since corrected): "NOTE TO SELF: double check the 45C threshold against bench data before final release." [sic - 'threshold' misspelling present in Vantek's internal draft]	Public documentation, Section 3.1, footnote 4: "Internal validation confirmed the 45C threshold against bench data." [sic - identical misspelling of 'threshold' appears in Halcyon's public documentation]
Section 4.4: Torque-compensation algorithm pseudocode, coefficients k1=0.087, k2=0.014, tuned via the proprietary notebook set (Coefficient_Tuning_Notebooks.zip).	Section 3.4: Torque-compensation algorithm pseudocode, coefficients k1=0.087, k2=0.014. No independent tuning methodology or dataset is disclosed or cited.

Note on the 'threshold' misspelling: The identical misspelling of 'threshold' as 'threshhold' appearing in both Vantek's internal, unreleased engineering draft and Halcyon's independently authored public documentation is offered as circumstantial evidence of direct copying rather than independent development, given the low likelihood of two independent engineering teams introducing and retaining an identical typographical error.

Prepared by outside counsel's technical consulting expert in connection with anticipated litigation; underlying public Halcyon documentation is independently discoverable.
